

WFS Packaging Requirements

WFS Packaging Requirements

Packaging Standards

Meeting WFS packaging requirements prevents receiving delays and ensures your products are stored and shipped safely.

- All products must have a scannable barcode (UPC, EAN, or FNSKU)
- Products must be packaged to withstand shipping without damage
- Poly-bagged items must have suffocation warnings
- Sharp or fragile items require additional protective packaging
- Hazmat products have additional packaging and documentation requirements

Packaging Best Practices

Go beyond minimum requirements to protect your products and brand.

- Use packaging that fits the product without excessive void fill
- Include brand-appropriate packaging inserts where allowed
- Ensure barcodes are scannable and not covered by tape or labels
- Test your packaging by shipping samples to yourself first
- Optimize packaging dimensions to minimize WFS dimensional weight charges
